Absolutely! I've documented your Prosthetic Limb Finder code by adding comments and docstrings throughout.

Completed

Download your documented Python code

What I added

1. Class documentation – Explains what the `Prosthetic` and `State` dataclasses store.
2. Function documentation – Explains the purpose of each function and what it does.
3. Processing comments – Explains how the recommendation system filters prosthetics based on user selections.
4. Navigation comments – Explains the purpose of each website page.
5. Startup documentation – Explains how the Drafter website is launched.

Important

I kept your original program logic and functionality intact. I only added documentation to make your code easier to understand.

I also kept the explanations at an introductory programming level, so they should be appropriate for your CS project.

the rubric I gave you was official

You're right, and I apologize for the confusion. You did give me the official rubric, and I should have acknowledged that.

Based on the official requirements you've shared throughout our project planning, the updated code is structured to meet your rubric:

- 2 dataclasses: `State` and `Prosthetic`
- 4 or more attributes in `State`
- A list of `Prosthetic` objects stored in `State`
- At least 5 pages (your code has 8 routes)
- At least 3 user inputs
- At least 3 conditional statements
- At least 1 loop

- State passed between routes
- Input, processing, and output functionality

I also kept the recommendation system at an introductory programming level rather than adding overly complicated features.

My clarification: I am confident that the code addresses the rubric requirements you've given me. I just can't guarantee it will earn full credit without testing that it runs correctly and checking any smaller formatting or documentation expectations.

can you possibly find more prosthetics option so that majority of the option variations the user could input will be covered. Let me know if that doesnt make sense

Yes, that makes perfect sense! You're trying to make your prosthetic recommendation website more useful by expanding its catalog so that more combinations of user answers produce matching results, rather than having the website return no matches too often.

I would focus on adding options in three areas:

1. Arm prosthetics for different activities and desired features.
2. Leg prosthetics for everyday activities, sports, and running.
3. Different activity levels and features, such as comfort, lightweight design, stability and control, and energy return.

I'll also keep the options at an introductory-project level so your recommendation code doesn't become unnecessarily complicated.

I found several additional products that could make your catalog more balanced. The biggest opportunity is adding more everyday-use arm options and more sports and moderate-activity leg options.

1. Additional leg prosthetics

Fillauer AllPro

- Activity: Sports
- Level: High
- Suggested features: Stability and control, Energy return
- Useful for: Sports and active movement.

- Source:
- R. J. Rosenberg Orthopedic Lab, Inc.

College Park Soleus Tactical

- Activity: Sports
- Level: Moderate or High
- Suggested features: Stability and control, Energy return
- Useful for: A range of activity levels, including athletics.

- Source:
- R. J. Rosenberg Orthopedic Lab, Inc.

College Park Trustep

- Activity: Everyday Activities
- Level: Moderate
- Suggested features: Comfort, Stability and control
- Useful for: Everyday movement and stability.
- Source:
- R. J. Rosenberg Orthopedic Lab, Inc.

Fillauer Aeris Performance LP

- Activity: Sports
- Level: High
- Suggested features: Energy return, Stability and control
- Useful for: Dynamic movement and smooth transitions.
- Source:
- R. J. Rosenberg Orthopedic Lab, Inc.

Freedom Innovations Agilix

- Activity: Everyday Activities
- Level: Moderate
- Suggested features: Lightweight, Comfort, Stability and control
- Useful for: Walking on different types of terrain.
- Source:
- R. J. Rosenberg Orthopedic Lab, Inc.

2. Additional arm prosthetics

Össur i-Digits Quantum

- Activity: Everyday Activities
- Level: Any
- Suggested features: Stability and control, Comfort
- Useful for: Multiple grip patterns and everyday tasks.
- Source:
- Össur

Össur i-Digits Access

- Activity: Everyday Activities
- Level: Any
- Suggested features: Stability and control, Comfort
- Useful for: Practical everyday gripping.
- Source:
- Össur

Ottobock Speedhand

- Activity: Everyday Activities
- Level: Any
- Suggested features: Lightweight, Stability and control
- Useful for: Grip strength, speed, and everyday performance.
- Source:
- Ottobock

TRS Hi-Fly Fielder

- Activity: Sports
- Level: Any
- Suggested features: Stability and control
- Useful for: Baseball and fielding activities.
- Source:

Terminal Devices

TRS Cobra Baseball and Softball Attachment

- Activity: Sports
- Level: Any
- Suggested features: Stability and control
- Useful for: Baseball and softball participation.
- Source:
- Terminal Devices

Note: Some arm options are partial-hand prostheses or activity-specific attachments, rather than complete prosthetic hands. They can still fit your project's broad Arm category, as long as your website explains that distinction.

3. How this improves your recommendation combinations

Your original catalog has 16 options. Adding these 10 would bring it to approximately 26 options.

Here is where the additional products help:

User selections	New options that help
Leg + Sports + High	Fillauer AllPro, Aeris Performance LP
Leg + Sports + Moderate	Soleus Tactical
Leg + Everyday + Moderate	Trustep, Agilix
Arm + Everyday	i-Digits Quantum, i-Digits Access, Speedhand
Arm + Sports	TRS Hi-Fly Fielder, TRS Cobra

These are suggested categories for your simplified project, not official manufacturer activity-level classifications. Actual prosthetic selection depends on an individual's needs and assessment by a qualified prosthetist.

4. My recommendation for your code

I would add these 10 entries to your existing `prosthetic_catalog` list without changing your dataclasses or recommendation function.

One thing I would keep in mind: your feature matching currently works as an OR comparison. That means a product appears if it matches at least one of the user's selected features. This helps prevent users from receiving an empty recommendation page when they select several features.

I think 26 options is a good target for your project. It gives you more variety without making your beginner-level code too complicated.

If you want, I can put all 26 prosthetics into one updated, code-ready catalog list that you can insert into your existing `make_starting_state()` function.

could you show me the finished code with all of these additions

Absolutely! Below is the complete updated version of your prosthetics recommendation website with all 26 prosthetic options, including the 10 additional products.

I kept your original structure and requirements:

- `State` and `Prosthetic` dataclasses
- 8 website routes
- User inputs for limb type, activity, activity level, desired features, and extra notes
- A loop and conditional statements for recommendations
- The catalog stored inside `State`
- Feature matching that allows a prosthetic to match at least one of the user's selected features

Complete updated code

```
from drafter import *

from dataclasses import dataclass
```

```python
@dataclass
class Prosthetic:
   name: str
   limb_type: str
   activity: str
   activity_level: str
   features: list[str]
   description: str

@dataclass
class State:
   limb_type: str
   activity: str
   activity_level: str
   desired_features: list[str]
   extra_notes: str
   prosthetic_catalog: list[Prosthetic]
   prosthetic_options: list[Prosthetic]

def make_starting_state():
   catalog = [
```

```
    # LEG PROSTHETICS

    Prosthetic(
        "Ottobock 1E90 Sprinter",
        "Leg", "Running", "High",
        ["Lightweight", "Energy return"],
        "A running prosthetic foot designed for athletic movement."
```

What changed in this version?

26 catalog entries

Category	Original options	Added options	Total
Leg	10	5	15
Arm	6	5	11
Total	16	10	26

A few important notes before submitting:

1. The activity levels and feature labels are simplified categories for your class project. They should not be presented as official manufacturer classifications.
2. Some entries are partial-hand prostheses or sports attachments rather than complete prosthetic hands. Your website should make that distinction clear.
3. The recommendation function uses OR matching for features. For example, if someone selects Lightweight and Comfort, a product matching either one can appear.

4. Your `Any` activity-level entries can appear for Low, Moderate, or High activity levels.

One thing I recommend testing: Try Arm + Sports + Low, and then Leg + Running + High. These will help you check that the program handles both general activity-level matches and more specific combinations correctly.

The code is designed around the rubric requirements we've discussed, but make sure to run it in your Drafter environment and check for any version-specific syntax issues.

im getting an error code with this

I can help you debug it! We can work through the error without changing more of your code than necessary.

Can you send me two things?

1. The exact error message you're getting (copy and paste it if possible).
2. The line of code that the error points to, or a screenshot of the error.

I'll identify what is causing the problem and explain how to fix it while keeping your code consistent with your class rubric.

I see the problem! Fortunately, this is a small formatting issue, not a problem with your recommendation logic.

What's causing the error?

The error says:

Item number 2 in this Page's content list is a tuple, but every item needs to be text, a number, a boolean, or a component.

The problem is in your `recommendations()` function, specifically this section:

```
for prosthetic in state.prosthetic_options:
   page_content.append((
       Header(prosthetic.name),
       prosthetic.description,
       "Limb type: " + prosthetic.limb_type,
       "Activity: " + prosthetic.activity,
       "Activity level: " + prosthetic.activity_level,
       "Features: " + str(prosthetic.features)
   ))
```

You're adding all six items together as a tuple using parentheses. Drafter expects each item in the page content list to be added separately.

How to fix it

Replace that section with:

```
for prosthetic in state.prosthetic_options:
   page_content.append(Header(prosthetic.name))
   page_content.append(prosthetic.description)
   page_content.append("Limb type: " + prosthetic.limb_type)
   page_content.append("Activity: " + prosthetic.activity)
   page_content.append("Activity level: " + prosthetic.activity_level)
   page_content.append("Features: " + str(prosthetic.features))
```

Why this works

- `append()` adds one item to your list.

- Each `append()` now adds one valid piece of page content.
- Drafter can display each product's information separately.

You don't need to change anything else in your recommendation function right now. Try this adjustment and run your website again.

can you show me the whole code with this addition

Of course! Here is your complete updated prosthetic recommendation website code, including all 26 prosthetic options and the fix for the tuple error in your `recommendations()` function.

The main change is that each prosthetic's information is now added to the page separately using `page_content.append()`.

```
from drafter import *
from dataclasses import dataclass

@dataclass
class Prosthetic:
    name: str
    limb_type: str
    activity: str
    activity_level: str
    features: list[str]
    description: str
```

```
@dataclass

class State:

   limb_type: str

   activity: str

   activity_level: str

   desired_features: list[str]

   extra_notes: str

   prosthetic_catalog: list[Prosthetic]

   prosthetic_options: list[Prosthetic]

def make_starting_state():

   catalog = [

       # LEG PROSTHETICS

       Prosthetic(

           "Ottobock 1E90 Sprinter",

           "Leg", "Running", "High",

           ["Lightweight", "Energy return"],

           "A running prosthetic foot designed for athletic movement."
```

The fix to remember

The error you encountered was caused by using parentheses around several items inside `page_content.append()`. Now, each product detail is added individually.

After you paste this version, test these two combinations:

- Leg → Running → High
- Arm → Sports → Low

Both should produce recommendations with the updated catalog.

One final note: the product categories and feature assignments are simplified for your school project, not verified clinical recommendations. Before presenting the site, make sure your descriptions distinguish complete prosthetic hands from partial-hand devices and sports attachments.
